ABSTRACT

This study aimed to investigate the genetic molecular mechanism of body color differentiation and variation of red tilapia, selecting the main genes related to the variation and cultivating the pure and stable red tilapia variety. The effects of different temperature treatments on body color and survival of Guam red tilapia, pearl white red tilapia and Florida red tilapia were compared. Besides, comparative transcriptome analysis was used to screen the candidate genes linked to the skin color differentiation of pearl white red tilapia. Among them, the body color of Guam red tilapia changed when the water temperature dropped to 16-14°C, and continued to drop to about 11°C, it was discolored in a large area reaching above 90%. According to the differential analysis: Tyrosine Kinase STYK1, HSP70, HSP30 and Transcription factor Sp6 expressions were significantly increased in the low temperature group, while MC1R, Transcription factor (MafB, jun-D, AP-1, E2F5, ETV6, Sp9, Sp7, E2F1, Sp4) expressions were notably decreased. Further, the color variation of red tilapia at low temperature may result from the change of tyrosine activity in the body. The in-depth study of its regulatory mechanism contributes to understanding the genetic mechanism of red tilapia and improving the body shape.

INTRODUCTION

Red Tilapia (genus *Oreochromis*), an essential tropical freshwater species is one of the most important edible fish in the world (Melo *et al.*, 2014). It is widely cultured because of its rapid growth and tender meat (Noraini *et al.*, 2013).

Fish belongs to poikilothermic animals whose body temperature varies with the environmental temperature (Yang *et al.*, 2004), water temperature affects the survival, growth, metabolism, reproduction of fish (Ross *et al.*, 2013). Tilapia is a warm-water fish with a temperature tolerance of 6-42 °C, but the tolerance to low temperature is influenced by water quality, fish age and health status (Nitzan *et al.*, 2016). The extreme freezing weather in China always caused great economic loss to the tilapia farming industry (Luan, 2010). A larger number of red

tilapia and wintering seedings that were ready for market were frozen and die under 8-10 °C of water temperature (Wang *et al.*, 2018a). Additionally, the time of seedling release of the early spring red tilapia with low cold tolerance would be delayed, leading to its market price volatile (He *et al.*, 2016). The supply and demand relationship of red tilapia was unbalanced, which had a major impact on the red tilapia breeding industry (El-Ebiary *et al.*, 2013). Therefore, the physiological study on the cold tolerance of red tilapia can provide data supporting for the breeding of cold-resistant red tilapia in the future.

Differentiation during genetic selection and variation in body color has been a growing limitation to the commercial value of red tilapia (Wang *et al.*, 2018b). The differentiation of body color in red tilapia is irreversible, while the change of skin color is reversible with the change of ambient temperature (Wang *et al.*, 2018a). Fish pigment cells are mainly distributed in skin, and fins and scales are derivatives of the skin, and pigment cells are widely distributed. Previous study has shown that the two types of melanin produced by melanocytes extremely influence on body color phenotype, one of which is eumelanin

^{*} Corresponding author: 260229251@qq.com; 0czg@163.com; ma463543285@126.com 0030-9923/2022/0001-0001 \$ 9.00/0 Copyright 2022 Zoological Society of Pakistan

being responsible for producing black and brown phenotypes, the other is brown melanin contributing to producing the yellow and red phenotypes (Kottler et al., 2015). The formation of melanin is a complex process requiring the maturation of melanocytes, the synthesis and transportation of melanin, in which regulatory factors and signaling molecules are involved in each stage (Poletini et al., 2016). The adenylate cyclase pathway, the protein kinase c pathway and the tyrosine pathway are three molecules and transduction pathways in melanocytes that synthesize melanin (Higanakamine et al., 2015). The common genetic signaling pathways of two pigments have been discovered (Mandal et al., 2010). The eumelanin is synthesized from tyrosine in vivo. Under the action of tyrosinase, tyrosine forms a eumelanin through a series of oxidation and catalytic polymerization (Chodurek et al., 2013). It turns to the synthetic pathway of brown melanin after the reduction of tyrosinase activity (Chodurek et al., 2013). Compared with other fish, little is known to the body color differentiation in red tilapia. Zhu et al. (2016) used comparative transcriptome sequencing to find the following genes related to skin color in red tilapia of three different colors: tyr, tyrp1, silv, sox10, slc24a5, CBS and slc7a11 (Zhu et al., 2016). The results showed that the miRNAs associated with red tilapia color mainly included slc7a11, mc1r and asip, predicating that miR-138-5p and miR-722 played an important role in the regulation of pigmentation. However, the molecular mechanism of body color differentiation remains unclear.

Thus, in this study, transcriptome sequencing was performed on the tissue samples of pearly white tilapia fin strips at low temperature and normal temperature to screen out the genes related to body color variation of red tilapia and provide a theoretical basis for the breeding of fine red tilapia strains.

MATERIALS AND METHODS

Sample collection

Thirtysamples, each of Guam red tilapia (GR), pearl white red tilapia (WR) and Florida red tilapia (FR), which were bred in the same year and weighed 10g, 80g and 120g, respectively were selected for the experiment. The animal experiment complying with the ARRIVE guidelines was carried out in accordance with the U.K. Animals (Scientific Procedures) Act, 1986 and associated guidelines, EU Directive 2010/63/EU for animal experiments. Different red tilapia strains were placed in diverse aquarium for 5 days at 20 °C to adapt to the living environment of the aquarium for subsequent temperature culture test. Fish were fasted for 24h before the trial. The circulating water filtration system was adopted in this experiment, and feeding was

conducted at 9:00 am and 4:00 pm, respectively every day. The laboratory temperature was artificially cooled, from 20 °C to 6 °C with gradient of 0.2 °C/2 h. During this period, water temperature was recorded every 2 h during the day and every 4 h at night. Meanwhile, data such as the deaths, the temperature at which the body color began to change, the location and degree of discoloration of red tilapia in each group were recorded. In the normal water temperature (20 °C) and cooling process (after 24 h of body color change), 3 fin tissues of WR were extracted for transcriptome sequencing respectively, stored in a -80 °C freezer before sequencing.

RNA isolation and cDNA library construction

Total RNA was extracted from tissue samples using MagZol Reagent. Then concentration and mass of each RNA sample was detected by nucleic acid protein detector (OD260: OD280) (Eppendorf, Germany) and agarose gel electrophoresis, respectively. The qualified RNA samples were enriched with magnetic beads with Oligo (dT). cDNA strand was synthesized with six base primers using enriched mRNA as template, and cDNA library was obtained by a series of modifications and PCR enrichment. The cDNA library was then quantitatively analyzed by Qbuit3.0, and the library insert size was detected by Agilent 2100 Bioanalyzer to ensure that the library effective concentration and quality meet the requirements of the RNA sequencing.

Transcriptome sequencing and de novo assembly of transcriptome

Each qualified cDNA library was sequenced using Illumina HiSeq2500 for 2×125 bp pair-end (PE) sequencing. Quality control of all raw reads was conducted by Fastqc (http://www.bioinformatics.babraham.ac.uk/ projects/fastqc/) software. Raw data obtained from sequencing were filtered, and connector sequences and low-quality reads were removed to obtain high quality clean data. Gene assembly analysis was performed on high quality clean data after quality control. Trinity (v2.2.0) analysis software based on DE Bruijn graphs was used for subsequent analysis to assemble the transcriptome sequencing data from scratch. The sequences output from Trinity software can be used for further analysis.

Assembled sequence annotation: Functional annotation

Functional annotation of the assembled sequences was performed by homology searches against the Uni Prot-Swiss Prot (The Universal Protein Resource) database, the GO (Gene Ontology) database, the KEGG (Kyoto Encyclopedia of Genes and Genomes) database and the TrEMBL protein database, and searches were conducted by the BLAST program.

RT-PCR analysis

Total RNA was isolated from samples by TRIzol method (Invitrogen, CA, USA), and cDNA was obtained by reverse transcription after DNA elimination. The results were calculated by ABI Prism 7500 RT-PCR system (Applied Biosystem, Foster City, CA, USA). Amplification was performed in a mixture (10 μ l) containing 5 μ l of 2X SYBR Green Master Mix, 1 µl of cDNA and 0.2 µl of each primer (10 µM). The thermal cycling curve consisted of an initial denaturation at 95°C for 5 min, followed by 40 cycles of 95 °C for 15 s, annealing/extension at 60 °C for 45s. Melting curve was generated by heating to 95 °C and cooling to 65 °C. All reactions were performed in triplicate and included a negative control without template. The value is based on identifying two biological replicates, each repeated 3 times. The gene expression level was normalized to β -actin expression in the same sample. A two-tailed t-test was used to compare expression levels.

RESULTS

Effect of temperature on apparent body color of red tilapia

When the temperature dropped to 15 °C, body color of the PR and FR with the various body weight began to change; body color of the PR and FR changed over large areas when the temperature was decreased to 11 °C, and the discoloration ratio is all over 90%. When the temperature dropped to 10.2 °C, GR (10 g) began to change color, as temperature continued to reduce, the total body color change ratio was about 6%. However, for GR (80 g and 120 g), the decrease of temperature has no effect on the change of body color (Table 1).

Table I. Changes of body color of different species of red tilapia at different temperatures.

Weight	Species	T ₁ (°C)	T ₂ (°C)	Discoloration ratio (%)
10 g	А	10.2	0	6
	В	15~13	11~9	91
	С	14~13	11.5~9.6	95
80 g	А	0	0	0

Transcriptome sequencing and assembly

In the gradient cooling culture process, the apparent body color of WR changed obviously. Thus, 3 fin tissues of WR in the normal water temperature (20 °C) and cooling process (after 24 h of body color change) were selected for transcriptome sequencing. In total, a mean of 8, 194, 153 paired-end (PE) clean reads for each library were obtained after data filtering and the sequencing quality was high with Q30 ratio larger than 96% for all samples (Table II).

We pooled all the clean reads from six libraries and de novo assembled them using Trinity. A total of 117,609 contigs, corresponding to unique genes of which length ranged from 201 bp to 9,868 bp. There were 27,273 (23.19%) contigs longer than 1,000 bp. The detailed length distribution of transcripts from the red tilapia is shown in Figure 1.

GO annotation and analysis of DEGs

Gene ontology (GO) annotation was then performed based on the Nr annotation and 34,542 contigs (29.37%) were assigned to GO term (Fig. 2). As shown in Figure 2, a total of 49 terms were assigned, including 23 (46.94%) biological process category, 13 (26.53%) cellular component terms and 13 (26.53%) molecular function terms. In the biological process category, cellular process was the most abundant term, followed by metabolic process biological regulation and pigmentation. For the cellular component category, cell and cell part were the predominant terms which were followed by organelle. For the molecular function category, binding was the main term, and it was followed by catalytic molecular transducer and transcription regulator (Fig. 2).

Functional annotation

All contigs were compared with four data bases including EMBL database, the UniProt-SwissProt database, KEGG database and GO database for functional annotation. There were 27997, 35370, 34542 assembled contigs that had significant hits against EMBL database, the UniProt-SwissProt database and GO database,

Identifying candidate genes involved in skin color and pigmentation

To show the differences in the skin color of red tilapia, we made a comparative analysis of two skin transcriptomes. Based on the standard that $|\log FC| \ge 1$ and FDR ≤ 0.5 , 3, 228 differentially expressed transcripts were identified between HLF7 and HLF3, which include 1,327 up-regulated transcripts and 1,901 down-regulated transcripts in HLF7. Candidate gene enrichment analysis identified 49 candidate genes involved in the processes of skin color and pigmentation from the two transcriptome data sets. Interestingly, six genes were revealed to be specifically expressed in HLF7, while 16 genes were only found expressed in HLF3 (Table IV).

DISCUSSION

We employed the transcriptome analysis to investigate the different gene expression of fin tissues of WR, indicating that the color change of red tilapia at low temperature arose from the co-regulation of multiple genes (tyrosine protein kinase *STYK1*, *HSP 70*, *HSP 30*, *HSP 90*, *MC1R* and transcription factor).

Heat shock protein (HSP70) is one of the most conservative and important proteins in HSPP family which is synthesized by the reaction of organism to the physical, chemical and biological stress agents in the environment (Shen et al., 2016). HSP70 gene can produce abundant heat stress proteins, remove the denatured proteins, protect the cells from the damage of denatured proteins, and reduce the impact of external stress environment on the body of fish when the cells are under stress (González-Aravena et al., 2018). Studies have found that the HSP70 mRNA expression in the liver was significantly increased after 12 h of low-temperature stress on the fish (Ming et al., 2012). It has been demonstrated that both low temperature and high temperature caused the rapid expression of HSP70 gene in the body cells of platy bream and the synthesis of heat stress protein (Ming et al., 2012). In our study, the

expression of HSP70 in HLF7 cultured at low temperature was significantly higher than that in normal temperature group, suggesting that the low temperature environment outside led to the changes in the physiological function of red tilapia. Besides, it is worth noting that the fry that has not yet fully developed are more susceptible to temperature changes and change their body color in our experiments, such as GR. Consistently, studies have shown that huge genetic variation in body color can provide a good indication of its potential improvement, and the body length and width of red tilapia are negatively correlated with body color (-0.47 to -0.25) (Hamzah *et al.*, 2017). However, the specific mechanism of this change still needs further study.

The biological basis of body color change in fish is the number, morphology and distribution of different pigment cells on skin and scales (Steffen et al., 2015). Compared with only a kind of pigment cell in the mammalian (melanocytes), bony fishes were found to have 6 kinds of pigment cells, including the melanocytes, red pigment cells, yellow pigment cells, rainbow, white and blue pigment cells, making the formation and changes of the fish body color more complicated and different red tilapia showing different body colors (Erickson, 2010). It has also been reported that MC1R gene, ASIP gene and TYRP1 gene are the major candidate genes of fish body color formation (Jian-Xiong et al., 2014). MC1R gene, as a key gene to produce melanin, expressed slightly in HLF7 of the low temperature group, and it was not the main reason for the formation of black spots (San-Jose et al., 2015). It is speculated that the formation of melanin by MC1R gene was affected by the albino gene. Meanwhile, the MCIR gene, which was related to the synthesis of melanin, represents a critical role in the formation of fish body color. However, MC1R expression was low in HLF7 in black-spotted red tilapia of the low-temperature group in our study, probably because it was an acute regulator and made pigments significantly deposited in the short term. And hence the surface of the skin was colored with streaks, and then black markings or red markings, but the expression level was stable.

It has been revealed that the body color of Mozambique tilapia became black in the dark after 25 h, but there was no significant change in MC1R expression in the epidermis and the α -MSH level in the serum. Therefore, the *MC1R* gene could also act as an acute regulator in the regulation of fish pigmentation, but the pigment is significantly deposited in a short period sine this activity expression cannot be maintained for a long time (Moorman *et al.*, 2015). So even if the red tilapia epidermis exhibited a certain color, there was no significant change in MC1R mRNA expression in fish tissues.

Tyrosinase is the rate-limiting enzyme of melanin synthesis vital for the rate and quantity of eumelanin and pheomelanin (Hirobe et al., 2011). During the formation of melanin, hormones, inorganic ions which are in vivo and external light, UV light physicochemical factors may affect the activity of TYR. Besides, the of the eumelanin to pheomelanin by ASIP gene was linked to the expression of the tyrosine family gene (TYR, TYRP1, DCT) and reduced its expression (Meng et al., 2014). Currently, the expression of gene related to the tyrosinase synthesis becomes an important indirect indicator of the energy of melanin formation in fish due to the absence of an effective method for determining the melanin content and body color index of fish (Chen et al., 2012). In addition, the coding transcription factors of pigment cells are also regulated by gene signal channels. It has been found that gene knockout can regulate the transcription factors of pigment cells in c-kit signal transduction, resulting in the loss of their function and pigmentation (Otsuki et al., 2020). Low temperature stress can also lead to changes in the expression of transcription factors. In our study, the expression of transcription factors decreased significantly at low temperature, but the related mechanism is unknown.

CONCLUSION

In this study, the body color of the GR with a small body weight changed significantly with temperature, and the melanin synthesis ability was enhanced in the low temperature group HLF7. The result was consistent with the tendency of red tilapia to become darker as the temperature gradient decreased. The pathway of melanin synthesis is a complex process involving the participation and regulation of polygene. Nevertheless, the overall melanin content, the ratio of eumelanin to brown melanin and the molecular metabolic mechanism of red tilapia body color variation was still needed to be further studied.

Supplementary Table I. KEGG pathway classification of contigs.

Pathway (Up_regulated)	Number of contigs (n)	Pathway (Down_regulated)	Number of contigs (n)
Carbon metabolism	10	Carbon metabolism	1
2 Oxocarboxylic acid metabolism	1	2-Oxocarboxylic acid metabolism	1
Fatty acid metabolism	3	Fatty acid metabolism	2
Biosynthesis of amino acids	9	Biosynthesis of amino acids	1
Degradation of aromatic compounds; Glycolysis Gluconeogenesis	9	Degradation of aromatic compounds; Glycolysis Gluconeogenesis; Citrate cycle TCA cycle; Pentose phosphate pathway	1
Citrate cycle TCA cycle	2	Pentose and glucuronate interconversions	2
Pentose phosphate pathway	5	Fructose and mannose metabolism	3
Pentose and glucuronate interconversions; Fruc- tose and mannose metabolism	4	Galactose metabolism; Ascorbate and aldarate metabolism; Starch and sucrose metabolism	1
Galactose metabolism	1	Amino sugar and nucleotide sugar metabolism	1
Ascorbate and aldarate metabolism; Starch and sucrose metabolism	2	Pyruvate metabolism; Glyoxylate and dicarboxylate metabolism; Propanoate metabolism; Butanoate metabolism; C5 Branched dibasic acid metabolism; Inositol phosphate metabolism	1
Amino sugar and nucleotide sugar metabolism	3	Oxidative phosphorylation	1
Pyruvate metabolism	4	Photosynthesis; Photosynthesis antenna proteins; Photosynthesis proteins; Carbon fixation in photo- synthetic organisms; Carbon fixation pathways in prokaryotes; Methane metabolism; Nitrogen metab- olism; Sulfur metabolism; Fatty acid biosynthesis	1
Glyoxylate and dicarboxylate metabolism	3	Fatty acid elongation	2

Pathway (Up_regulated)	Number of contigs (n)	Pathway (Down_regulated)	Number of contigs (n)
Propanoate metabolism	1	Fatty acid degradation; Synthesis and degradation of ketone bodies; Cutin suberine and wax biosyn- thesis; Steroid biosynthesis	5
Butanoate metabolism; C5 Branched dibasic acid metabolism; Inositol phosphate metabolism	1	Primary bile acid biosynthesis	1
Oxidative phosphorylation	7	Secondary bile acid biosynthesis; Steroid hormone biosynthesis	1
Photosynthesis; Photosynthesis antenna proteins; Photosynthesis proteins; Carbon fixation in photo- synthetic organisms	5	Glycerolipid metabolism	2
Carbon fixation pathways in prokaryotes	1	Glycerophospholipid metabolism	3
Methane metabolism	5	Ether lipid metabolism	1
Nitrogen metabolism	3	Sphingolipid metabolism; Arachidonic acid metabolism	5
Sulfur metabolism	1	Linoleic acid metabolism	1
Fatty acid biosynthesis; Fatty acid elongation	8	alpha Linolenic acid metabolism	1
Fatty acid degradation	1	Biosynthesis of unsaturated fatty acids	2
Synthesis and degradation of ketone bodies; Cutin suberine and wax biosynthesis; Steroid biosynthe- sis; Primary bile acid biosynthesis	1	Lipid biosynthesis proteins; Purine metabolism	3
Secondary bile acid biosynthesis; Steroid hormone biosynthesis	9	Pyrimidine metabolism	3
Glycerolipid metabolism	1	Alanine aspartate and glutamate metabolism	3
Glycerophospholipid metabolism	1	Glycine serine and threonine metabolism; Cysteine and methionine metabolism	3
Ether lipid metabolism	1	Valine leucine and isoleucine degradation	3
Sphingolipid metabolism	2	Valine leucine and isoleucine biosynthesis; Lysine biosynthesis	1
Arachidonic acid metabolism	4	Lysine degradation	5
Linoleic acid metabolism; alpha Linolenic acid metabolism; Biosynthesis of unsaturated fatty acids	7	Arginine biosynthesis; Arginine and proline metabolism	1
Lipid biosynthesis proteins; Purine metabolism	10	Histidine metabolism; Tyrosine metabolism	3
Pyrimidine metabolism	9	Phenylalanine metabolism	3
Alanine aspartate and glutamate metabolism	3	Tryptophan metabolism	4
Glycine serine and threonine metabolism	1	Phenylalanine tyrosine and tryptophan biosynthesis	3
Cysteine and methionine metabolism	3	Amino acid related enzymes; beta Alanine metabo- lism; Taurine and hypotaurine metabolism	3
Valine leucine and isoleucine degradation; Valine leucine and isoleucine biosynthesis; Lysine biosyn- thesis; Lysine degradation	2	Phosphonate and phosphinate metabolism; Seleno- compound metabolism; Cyanoamino acid metabo- lism	3
Arginine biosynthesis	2	D Glutamine and D glutamate metabolism; D Arginine and D ornithine metabolism; D Alanine metabolism; Glutathione metabolism	3
Arginine and proline metabolism	4	Glycosyltransferases; N Glycan biosynthesis; Vari- ous types of N glycan biosynthesis	1
		Table continue on next page	

Pathway (Up_regulated)	Number of contigs (n)	Pathway (Down_regulated)	Number of contigs (n)
Histidine metabolism; Tyrosine metabolism; Phe- nylalanine metabolism; Tryptophan metabolism	3	Mucin type O glycan biosynthesis	1
Phenylalanine tyrosine and tryptophan biosyn- thesis; Amino acid related enzymes; beta Alanine metabolism	1	Other types of O glycan biosynthesis	2
Taurine and hypotaurine metabolism	1	Glycosaminoglycan biosynthesis chondroitin sul- fate dermatan sulfate; Glycosaminoglycan biosyn- thesis heparan sulfate heparin; Glycosaminoglycan biosynthesis keratan sulfate; Proteoglycans; Glycos- aminoglycan binding proteins; Glycosylphosphati- dylinositol GPI anchored proteins; Glycosamino- glycan degradation	1
Phosphonate and phosphinate metabolism; Selen- ocompound metabolism; Cyanoamino acid metab- olism; D Glutamine and D glutamate metabolism; D Arginine and D ornithine metabolism; D Alanine metabolism; Glutathione metabolism	4	Glycosylphosphatidylinositol GPI anchor biosyn- thesis; Glycosphingolipid biosynthesis lacto and neolacto series	1
Glycosyltransferases; N Glycan biosynthesis; Var- ious types of N glycan biosynthesis; Mucin type O glycan biosynthesis	2	Glycosphingolipid biosynthesis globo series; Glycosphingolipid biosynthesis ganglio series; Li- popolysaccharide biosynthesis; Lipopolysaccharide biosynthesis proteins; Peptidoglycan biosynthesis; Other glycan degradation; Thiamine metabolism; Riboflavin metabolism; Vitamin B6 metabolism; Nicotinate and nicotinamide metabolism	8
Other types of O glycan biosynthesis; Glycos- aminoglycan biosynthesis chondroitin sulfate dermatan sulfate; Glycosaminoglycan biosynthesis heparan sulfate heparin	1	Pantothenate and CoA biosynthesis; Biotin metabolism	1
Glycosaminoglycan biosynthesis keratan sulfate	1	Lipoic acid metabolism; Folate biosynthesis; One carbon pool by folate; Retinol metabolism	3
Proteoglycans; Glycosaminoglycan binding pro- teins; Glycosylphosphatidylinositol GPI anchored proteins; Glycosaminoglycan degradation; Glyco- sylphosphatidylinositol GPI anchor biosynthesis; Glycosphingolipid biosynthesis lacto and neolacto series	1	Porphyrin and chlorophyll metabolism; Ubiquinone and other terpenoid quinone biosynthesis; Prenyl- transferases; Terpenoid backbone biosynthesis	1
Glycosphingolipid biosynthesis globo series	1	Monoterpenoid biosynthesis; Sesquiterpenoid and triterpenoid biosynthesis	1

Comparative Transcriptome Analysis Depicts Candidate Genes Involved in Skin Color

Glycosphingolipid biosynthesis ganglio series	1	Diterpenoid biosynthesis; Carotenoid biosynthe- sis; Brassinosteroid biosynthesis; Insect hormone biosynthesis; Zeatin biosynthesis; Limonene and pinene degradation; Geraniol degradation; Polyketide biosynthesis proteins; Type I polyketide structures; Biosynthesis of 12 14 and 16 membered macrolides; Biosynthesis of ansamycins; Biosyn- thesis of type II polyketide backbone; Biosynthe- sis of type II polyketide products; Tetracycline biosynthesis; Polyketide sugar unit biosynthesis; Nonribosomal peptide structures; Biosyn- thesis of vancomycin group antibiotics; Phenyl- propanoid biosynthesis; Stilbenoid diarylheptanoid and gingerol biosynthesis; Flavonoid biosynthesis; Flavone and flavonol biosynthesis; Indole	3
		alkaloid biosynthesis; Indole diterpene alkaloid biosynthesis; Isoquinoline alkaloid biosynthesis	
Lipopolysaccharide biosynthesis; Lipopolysac- charide biosynthesis proteins; Peptidoglycan biosynthesis; Other glycan degradation; Thiamine metabolism; Riboflavin metabolism	2	Tropane piperidine and pyridine alkaloid biosyn- thesis; Acridone alkaloid biosynthesis; Caffeine metabolism; Betalain biosynthesis; Glucosinolate biosynthesis; Benzoxazinoid biosynthesis; Penicil- lin and cephalosporin biosynthesis; Carbapenem biosynthesis; Monobactam biosynthesis; Clavulan- ic acid biosynthesis; Streptomycin biosynthesis; Butirosin and neomycin biosynthesis; Puromycin biosynthesis; Novobiocin biosynthesis; Aflatoxin biosynthesis; Benzoate degradation; Aminobenzo- ate degradation; Fluorobenzoate degradation; Chlo- roalkane and chloroalkene degradation; Chlorocy- clohexane and chlorobenzene degradation; Toluene degradation; Ethylbenzene degradation; Styrene degradation; Atrazine degradation; Caprolactam degradation; 1 1 1 Trichloro 2 2 bis 4 chlorophenyl ethane DDT degradation; Nisphenol degradation; Dioxin degradation; Naphthalene degradation; Fur- fural degradation; Steroid degradation; Fur- fural degradation; Steroid degradation; Fur- fural degradation; Steroid degradation; Metabolism of xenobiotics by cytochrome P450; Drug metabo- lism cytochrome P450	1
Vitamin B6 metabolism; Nicotinate and nicotina- mide metabolism	5	Drug metabolism other enzymes; Enzymes; Protein kinases; Protein phosphatase and associated pro- teins; Peptidases; Cytochrome P450; KEGG mod- ules in global; RNA polymerase; Basal transcription factors	1
Pantothenate and CoA biosynthesis; Biotin metab- olism; Lipoic acid metabolism; Folate biosynthe- sis; One carbon pool by folate	1	Transcription factors; Transcription machinery; Spliceosome	2
Retinol metabolism	8	Spliceosome; Ribosome	1
Porphyrin and chlorophyll metabolism; Ubiqui- none and other terpenoid quinone biosynthesis; Prenyltransferases; Terpenoid backbone biosyn- thesis	1	Ribosome; Transfer RNA biogenesis; Aminoacyl tRNA biosynthesis; RNA transport; mRNA surveil- lance pathway	1

Monoterpenoid biosynthesis; Sesquiterpenoid and 1 triterpenoid biosynthesis; Diterpenoid biosynthesis; Carotenoid biosynthesis; Brassinosteroid biosynthesis; Insect hormone biosynthesis; Zeatin biosynthesis; Limonene and pinene degradation; Geraniol degradation; Polyketide biosynthesis proteins; Type I polyketide structures; Biosynthesis of 12 14 and 16 membered macrolides; Biosynthesis of ansamycins; Biosynthesis of type II polyketide backbone; Biosynthesis of type II polyketide products; Tetracycline biosynthesis; Polyketide sugar unit biosynthesis; Nonribosomal peptide structures; Biosynthesis of siderophore group nonribosomal peptides; Biosynthesis of vancomycin group antibiotics; Phenylpropanoid biosynthesis; Stilbenoid diarylheptanoid and gingerol biosynthesis; Flavonoid biosynthesis; Flavone and flavonol biosynthesis; Anthocyanin biosynthesis; Isoflavonoid biosynthesis; Indole alkaloid biosynthesis; Indole diterpene alkaloid biosynthesis; Isoquinoline alkaloid biosynthesis; Tropane piperidine and pyridine alkaloid biosynthesis; Acridone alkaloid biosynthesis; Caffeine metabolism; Betalain biosynthesis; Glucosinolate biosynthesis; Benzoxazinoid biosynthesis; Penicillin and cephalosporin biosynthesis; Carbapenem biosynthesis; Monobactam biosynthesis; Clavulanic acid biosynthesis; Streptomycin biosynthesis

Butirosin and neomycin biosynthesis; Puromycin biosynthesis; Novobiocin biosynthesis; Aflatoxin biosynthesis; Benzoate degradation

Aminobenzoate degradation; Fluorobenzoate degradation; Chloroalkane and chloroalkene degradation; Chlorocyclohexane and chlorobenzene degradation; Toluene degradation; Xylene degradation; Nitrotoluene degradation; Ethylbenzene degradation; Styrene degradation; Atrazine degradation; Caprolactam degradation; 1 1 1 Trichloro 2 2 bis 4 chlorophenyl ethane DDT degradation; Bisphenol degradation; Dioxin degradation; Naphthalene degradation; Polycyclic aromatic hydrocarbon degradation; Furfural degradation; Steroid degradation; Metabolism of xenobiotics by cytochrome P450

Drug metabolism cytochrome P450
Drug metabolism other enzymes;Enzymes; Pro- tein kinases;Protein phosphatase and associated proteins; Peptidases; Cytochrome P450; KEGG modules in global; RNA polymerase; Basal tran- scription factors
Transcription factors; Transcription machinery; Spliceosome
Spliceosome; Ribosome
